### *What Is AZOMITE?*

**AZOMITE®** is a naturally rich soil re-mineralizer for plants and a unique trace mineral booster for animals.

**AZOMITE®** is a registered trade name and is an acronym for “**A to Z of Minerals Including Trace Elements**”.

**AZOMITE®** is 100% natural, contains more than 67 trace mineral elements and is certified organic by the Organic Materials Review Institute (OMRI) in the United States.

**AZOMITE®** is mined from a 30 million year old volcanic ash deposit with minerals unlike any volcanic deposit in the world. The mine is located in Utah, USA.

**AZOMITE®** is unique because the ancient volcano spewed ash into an ancient seabed. This combination of seawater --- fed by hundreds of rivers rich in minerals --- and the rare and abundant minerals present in volcanic ash created the **AZOMITE®** deposit which is found nowhere else on Earth.

Crop farmers use **AZOMITE®** to replenish the trace mineral content in the soil, to increase the number and size of fruits and vegetables per plant, and to help plants contend with disease.

Animal producers use **AZOMITE®** to increase average daily lean gain, to help animals contend with disease, and to improve feed conversion ratio.

**AZOMITE®** is now sold on every continent and in over 35 countries.

There are large amounts of scientific and anecdotal data confirming the beneficial and profitable results of using **AZOMITE®**.
