Subject: Azomite Testimonial

Hello Wes:

I just wanted to tell you of the fantastic experience that I've had with AZOMITE.

I have a peach tree that's been fertilized using conventional fruit tree spikes. Peach trees traditionally do not do well in Florida because of the humidity. Using these spikes, the tree did bear, but the fruit was sparse and wormy. The leaves also had a fungal infection which no conventional product could correct.

In early Spring of 2003, I placed a whole bag of AZOMITE powder under the tree. In retrospect, I believe that was too much, because the tree beared too much fruit. For almost three weeks I would collect about 4-5supermarket bags full of peaches. They were large, sweet, flavorfull, unblemished, and without a single worm. It beared so much that I bombarded my family and friends with peaches and also had to find strangers to give them to. I also froze several bags. In addition, the fungal infection also went away. The tree did suffer however. It was so laden with fruit that many of the branches simply broke under the weight.

This year I decided not to place AZOMITE under that tree because I over fertilized last year. This was a mistake. Florida soil is very sandy and anyfertilizer will quickly leach through the top soil. Without AZOMITE, the tree gave a very low yeild and many of the peaches were wormy and of poor quality.

Please send me a bag of AZOMITE granular. I'll place much less than last year, but I want to protect the roots throughout the winter. Next Spring I'll also place a smaller amount under the tree. But, I know I'll have a good yeild of wonderful, sweet peaches.

Sincerely,  
Patrick Lecky  
Ocoee, FL

Dear Mr. Emerson,

We are organic growers of peaches, nectarines, cherries, and apricots here in California. For years, we had been losing the battle against brown rot, a disease devastating to our crops. After using Azomite, broadcast at the rate of about 5 pounds per tree, we began noticing a dramatic decrease in brown rot. This fact alone would be enough to motivate me to continue using Azomite and to highly recommend it to any organic grower of stone fruit.

But the real kicker is that Azomite seems to add a complexity and intensity of flavors to all the fruit we grow here at Frog Hollow Farm. Please ship us another truckload.

Enthusiastically,

Al Courchesne  
Owner, Frog Hollow Farm
